Presented by Ryan Head

Why We're Here Today:

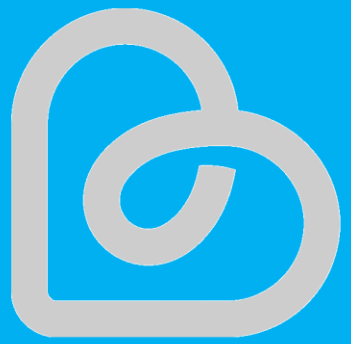

-To peer into the real-world daily routines of twenty-first-century women and how Bellabeat can best serve their needs.

How We're Doing This:

-We analyzed behavior data from smart-wearable Fitbit devices from April, 2016 through May, 2016.

-We uncovered critical lifestyle patterns that tell a clear story.

Today, I will present our findings and give suggestions for how we can draw from these findings to improve our Bellabeat products.

What we looked at:

-Daily Activity
-Steps
-Weight Logging
-Participation Levels of all the above.

Our Unique Position:

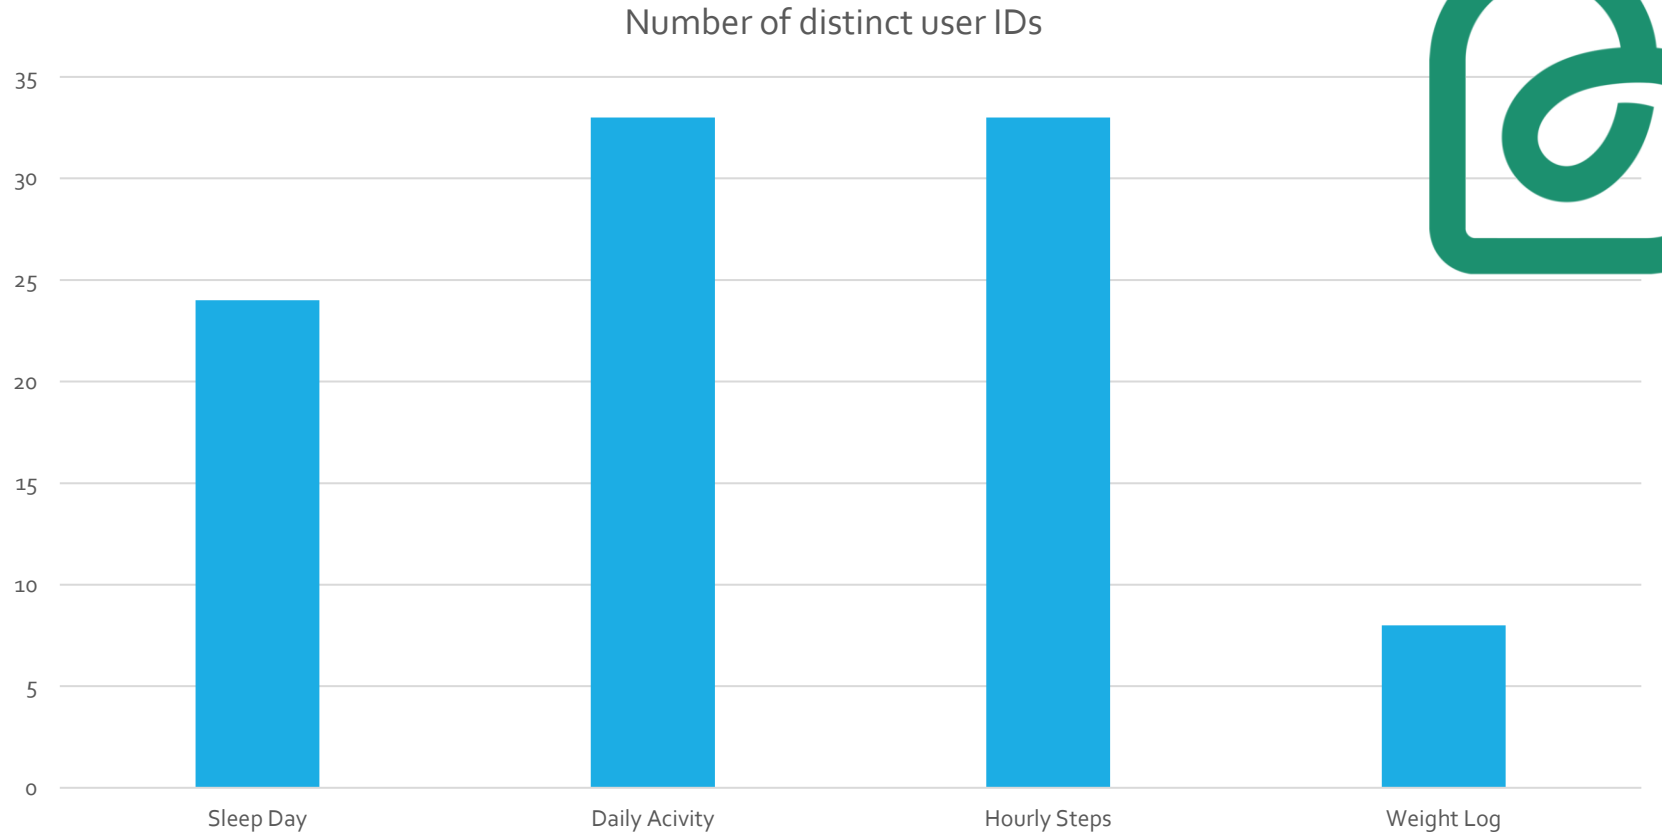

Bellabeat holds the unique edge of bridging the gap between sophisticated data and fine women's fashion.

The Problem:

-Health data is only valuable if users actually track it. We found significant drop-offs in metrics like weight tracking.

Data Selection and Staging:
We isolated data spanning April, 12th, 2016 – May, 12th, 2016 in order to maintain data integrity over different user IDs and missing sleep data for March data.

This resulted in 33 active trackers for daily activity and steps, 24 for sleep tracking, and only 8 for weight logging.

The Numbers, Step-by-Step:

Metrics showed an average of 7,683 steps per day, short of the standard of 10,000.

However, the average activity levels may be more telling in this case.

Data showed an average of 16.5 hours of sedentary time, 3.2 hours lightly active, 13.6 minutes fairly active, and 21.2 minutes at a very active level per day.

Sedentary Tiers vs. Sleep Duration

We asked if long sedentary durations shorten sleep cycles and this is what the numbers show:

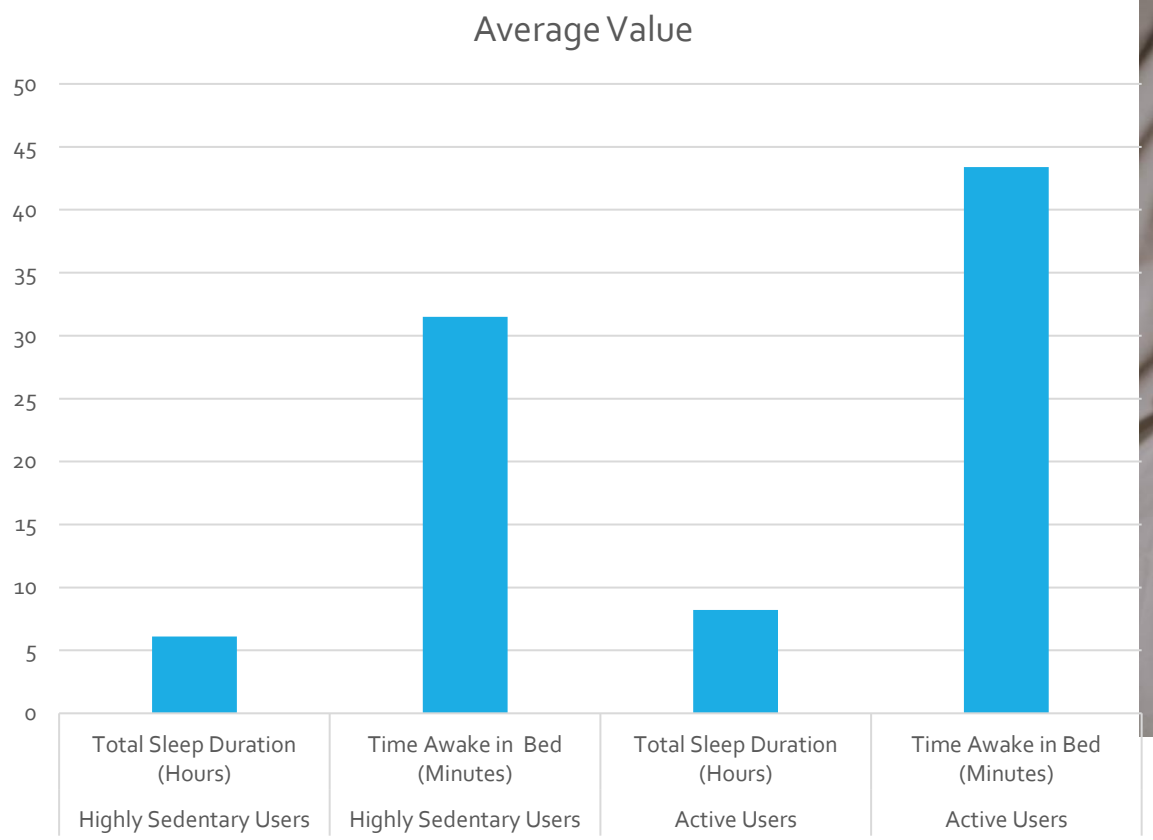

- Highly sedentary users (>12 hours) averaged 6.1 hours of sleep per day.
- Active/low sedentary users (<8 hours sedentary) averaged 8.2 hours of sleep.

Author's analysis of Fitbit Fitness Tracker Data via Tableau Desktop.

The Restlessness Paradox:

- Highly sedentary users spent the least time awake in bed (31.5 minutes) compared to highly active users (43.4 minutes). This data may be a result of "sleep debt." Highly sedentary users, who are chronically sleep-deprived may fall asleep quicker due to sheer exhaustion. Active users experience a more natural "winding down" period.

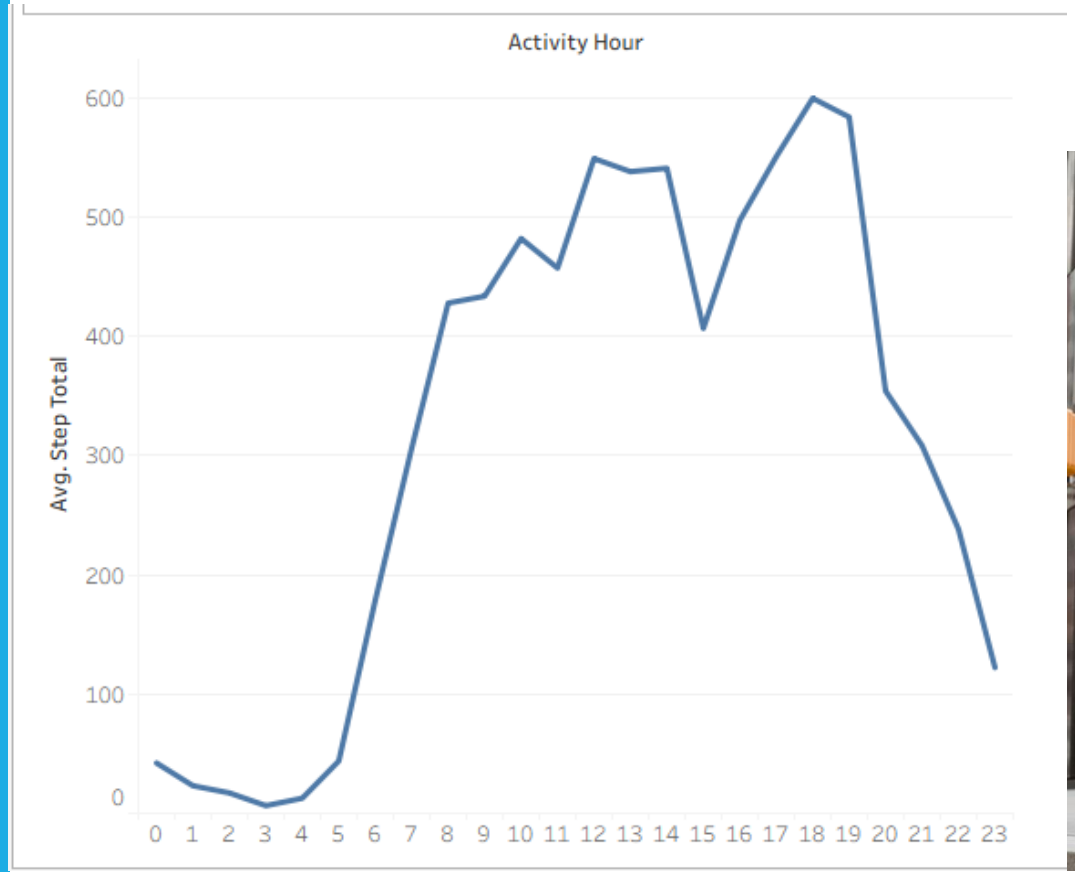

Author's analysis of Fitbit Fitness Tracker Data via Microsoft Excel.

Hourly "Time of Day" Trends:

Data showed peak active hours at 6PM, 5PM, 7PM, and noon. This suggests higher activity at lunch breaks and end of workdays. So, later times may be when users are most receptive to mobile interaction.

Weight Log Engagement Gap

- We saw over a 75% drop-off in user retention for recording weight data.
- With only 8 users recording their weight logs, 5 users manually reported and 3 used automatic logging.
- This suggests an opportunity for encouraging more user-engagement with possible recording process changes

Recommendations:

1) Alerts to remind users to increase their activity once a certain number of consecutive sedentary hours is reached.
2) Nightly “wind-down” features: Automated screen-free alerts, gentle sounds, etc. for users to ease into deep rest.
3) Increase marketing for Bellabeat Balance Smart digital scale to sync with the Bellabeat app to increase weight logging.

Conclusion:

Using these findings with a proper focus to action may help Bellabeat to increase its appeal to our customer base by better meeting their needs.

Future studies with larger sample sizes and more specific focus on women may yield even more helpful insights.

Thank you for your time.

Now, let’s open up for any questions.
